THE AGI COMPUTER

Theseus is a layer-1 blockchain with a completely new runtime designed for AI. It starts with the premise that sovereignty requires no private key ownership, so we allow agents to be hosted similarly to traditional smart contracts. We also add on numerous technical innovations, such as:

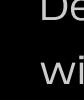

#### Tensor Commitments

The most efficient way to verify inference in a public shared state environment

#### Terkle Trees

The first generalization of Verkle Trees to tensors

#### The AIVM

Dedicated virtual machine specifically with ML opcodes and a method to translate raw natural inference to strict on-chain actions

## We Uniquely Enable 1T+ markets

### Free Sovereign Agents

Autonomous agents with the capacity for self-governance and independent decision-making. These agents act on their own goals, enabling true free will in machine intelligence, similar to AGI.

### Trustless Human-Controlled Agents

Agents guided by humans that can transact and coordinate without centralized intermediaries. This introduces trustless value exchange between agents, a breakthrough for AI similar to what Bitcoin did for money.

### Lighthouse AI

AI systems built to serve as public infrastructure. Transparent, auditable, and aligned with collective interests; they bring the benefits of smart contracts to decentralized intelligence.
